

# **Application of Satellite Data to Protected Species Management and Bycatch Estimation**

By Chris Orphanides

# Goals of Presentation

- 1) Provide a brief overview of the use of satellite-derived datasets in the NEFSC
- 2) Show how these data have been made accessible and used for Protected Species Bycatch Estimation and Management

# Monitoring Ecosystem Primary Production

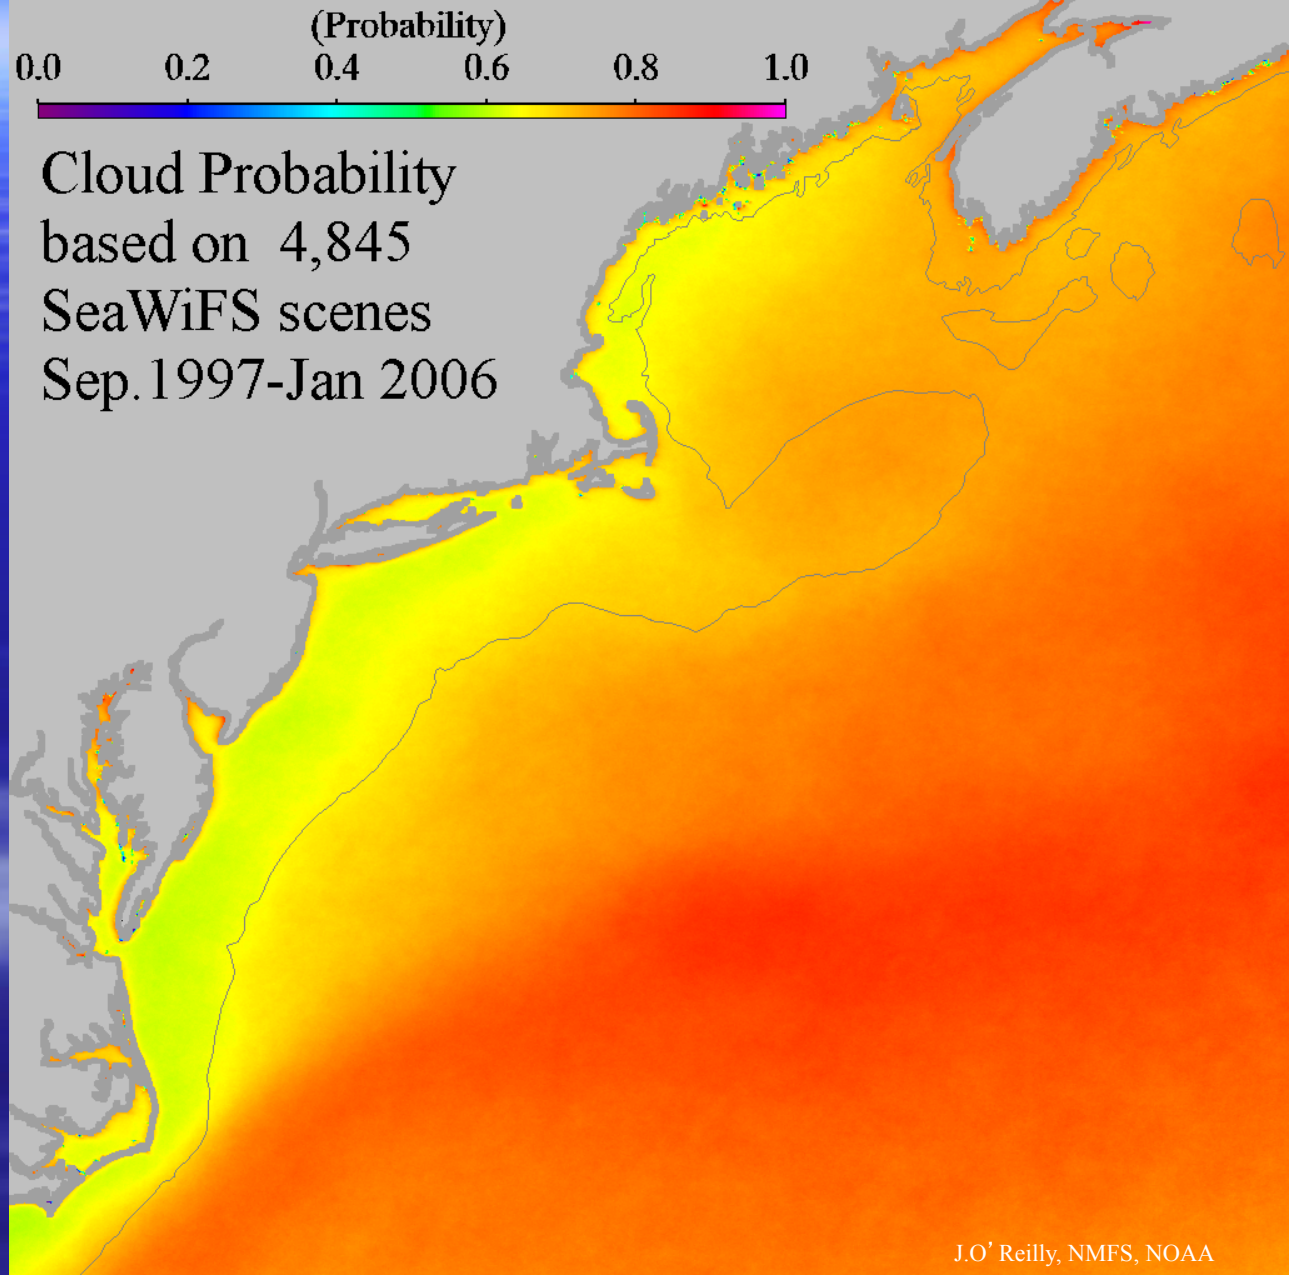

With Satellite  
Ocean Color &  
Thermal Sensors

**Clouds ???**

Region	Good Data
Nearshore	~ 2.5 days
Outer Shelf	~ 4 days
Slope Water	~ 5 days
Gulf Stream	~ 9 days

**Satellite Sensors:  
Good ecosystem  
monitoring method  
for this region**

## Cloud Probability

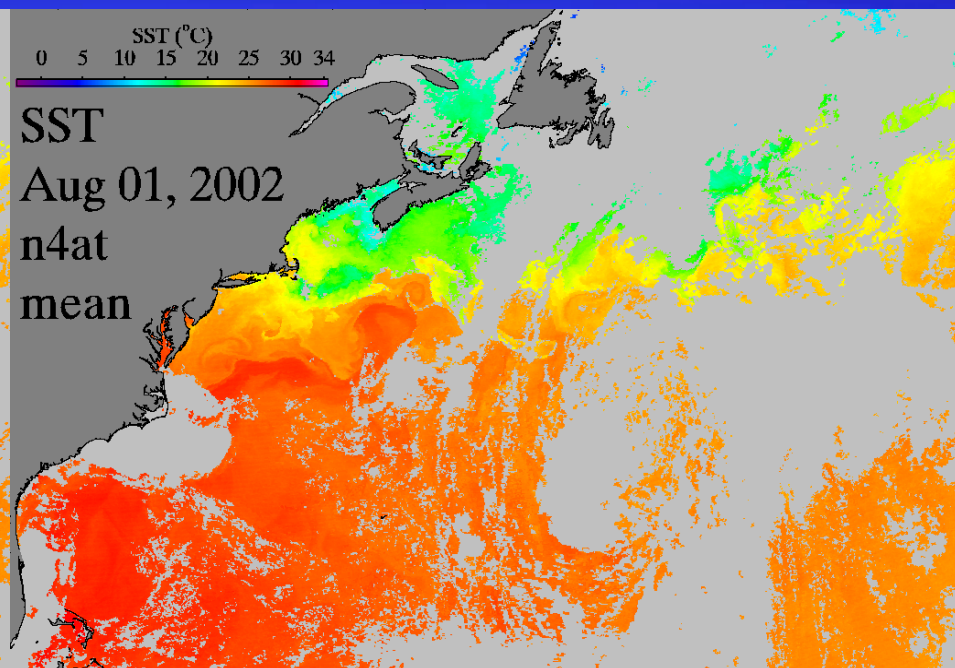

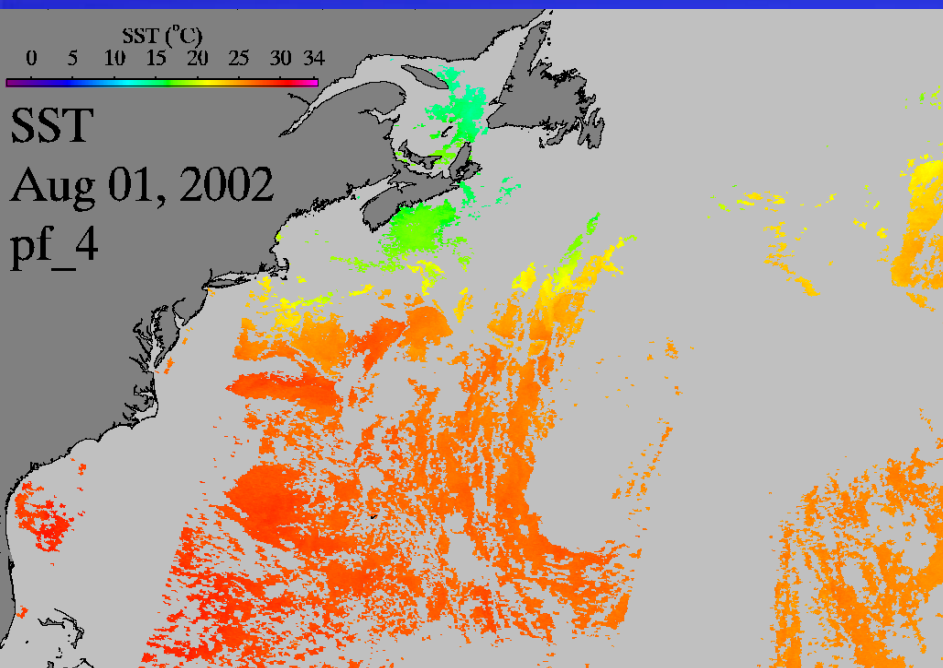

# Sea Surface Temperature - Merged Product -

- SST derived from multiple satellites to remove clouds
- Sources include: Pathfinder (AVHRR), MODIS Aqua, MODIS Terra, and GOES

Credit: J. O' Reilly, C. Orphanides, T. Ducas, and G.Wood

# Oceanographic and Environmental Data Types

- Sea Surface Temperature (SST)
- Surface Chlorophyll *a*
- Productivity Model
- Oceanographic Fronts
  - Frontal Strength (gradient)
  - Frontal Direction
- Bathymetric data
  - Bottom Depth
  - Bottom Slope

# NEFSC Use of Satellite Data

## Some NEFSC Uses of Satellite Data:

- Definition of ecological sub-units
- Development of productivity model
  - Input into EMAX (Energy Modeling and Analysis eXercise) ecological modeling program
  - Input into ECoS (Eastern Continental Shelf Carbon Budget)
- Analysis of Atlantic Herring Fishery
- Proposed analysis of Northern Shrimp Fishery
- Protected Species Analysis

# NEFSC PSB Use of Satellite Data

## Application of Satellite Data in the NEFSC

### Protected Species Branch :

- Development of tools to link satellite data with fisheries datasets
- Analysis of turtle bycatch in longlines
- Bycatch estimates of turtle bycatch in bottom trawl and scallop dredge fisheries
- Bycatch estimates of cetaceans in trawl fisheries
- Assisting in marine mammal abundance surveys
- Habitat investigations

# **Workflow – Applying Satellite Data to Fisheries Datasets**

- 1. Download Satellite Data**
- 2. Make composite satellite images (using IDL)**
- 3. Convert Images to ArcGIS ready format (using IDL)**
- 4. Read images into an ArcGIS raster format (with ArcGIS)**
- 5. Set proper map projections (with ArcGIS)**
- 6. Sample satellite data for fishing locations using custom tools**

# Tool Example – Retrieving Satellite Data for Fishing Locations

Retrieve Satellite Data for Fishing Point Locations

### Select Shapefile and Raster Locations

Fishing Point Location:

SST 5-day Raster Location:

SST Climatology Raster Location:

SST Fronts 5-day Raster Location:

Chlorophyll 5-day Raster Location:

### Select Output Data

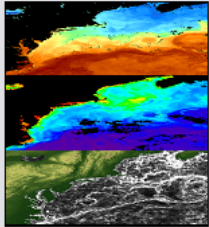

**SST**

☐ SST - 5-day Composites - Point Locations

☐ SST - 5-day Composites - 3x3 cell median

☐ SST - Climatology - Point Locations

☐ SST - Climatology - 3x3 cell median

**Chlorophyll**

☐ Chlorophyll - 5-day Composites - Point Locations

☐ Front Estimation (SST Difference)

☐ Front Estimation (from 5-day SST) - Point Locations

Help Run Quit

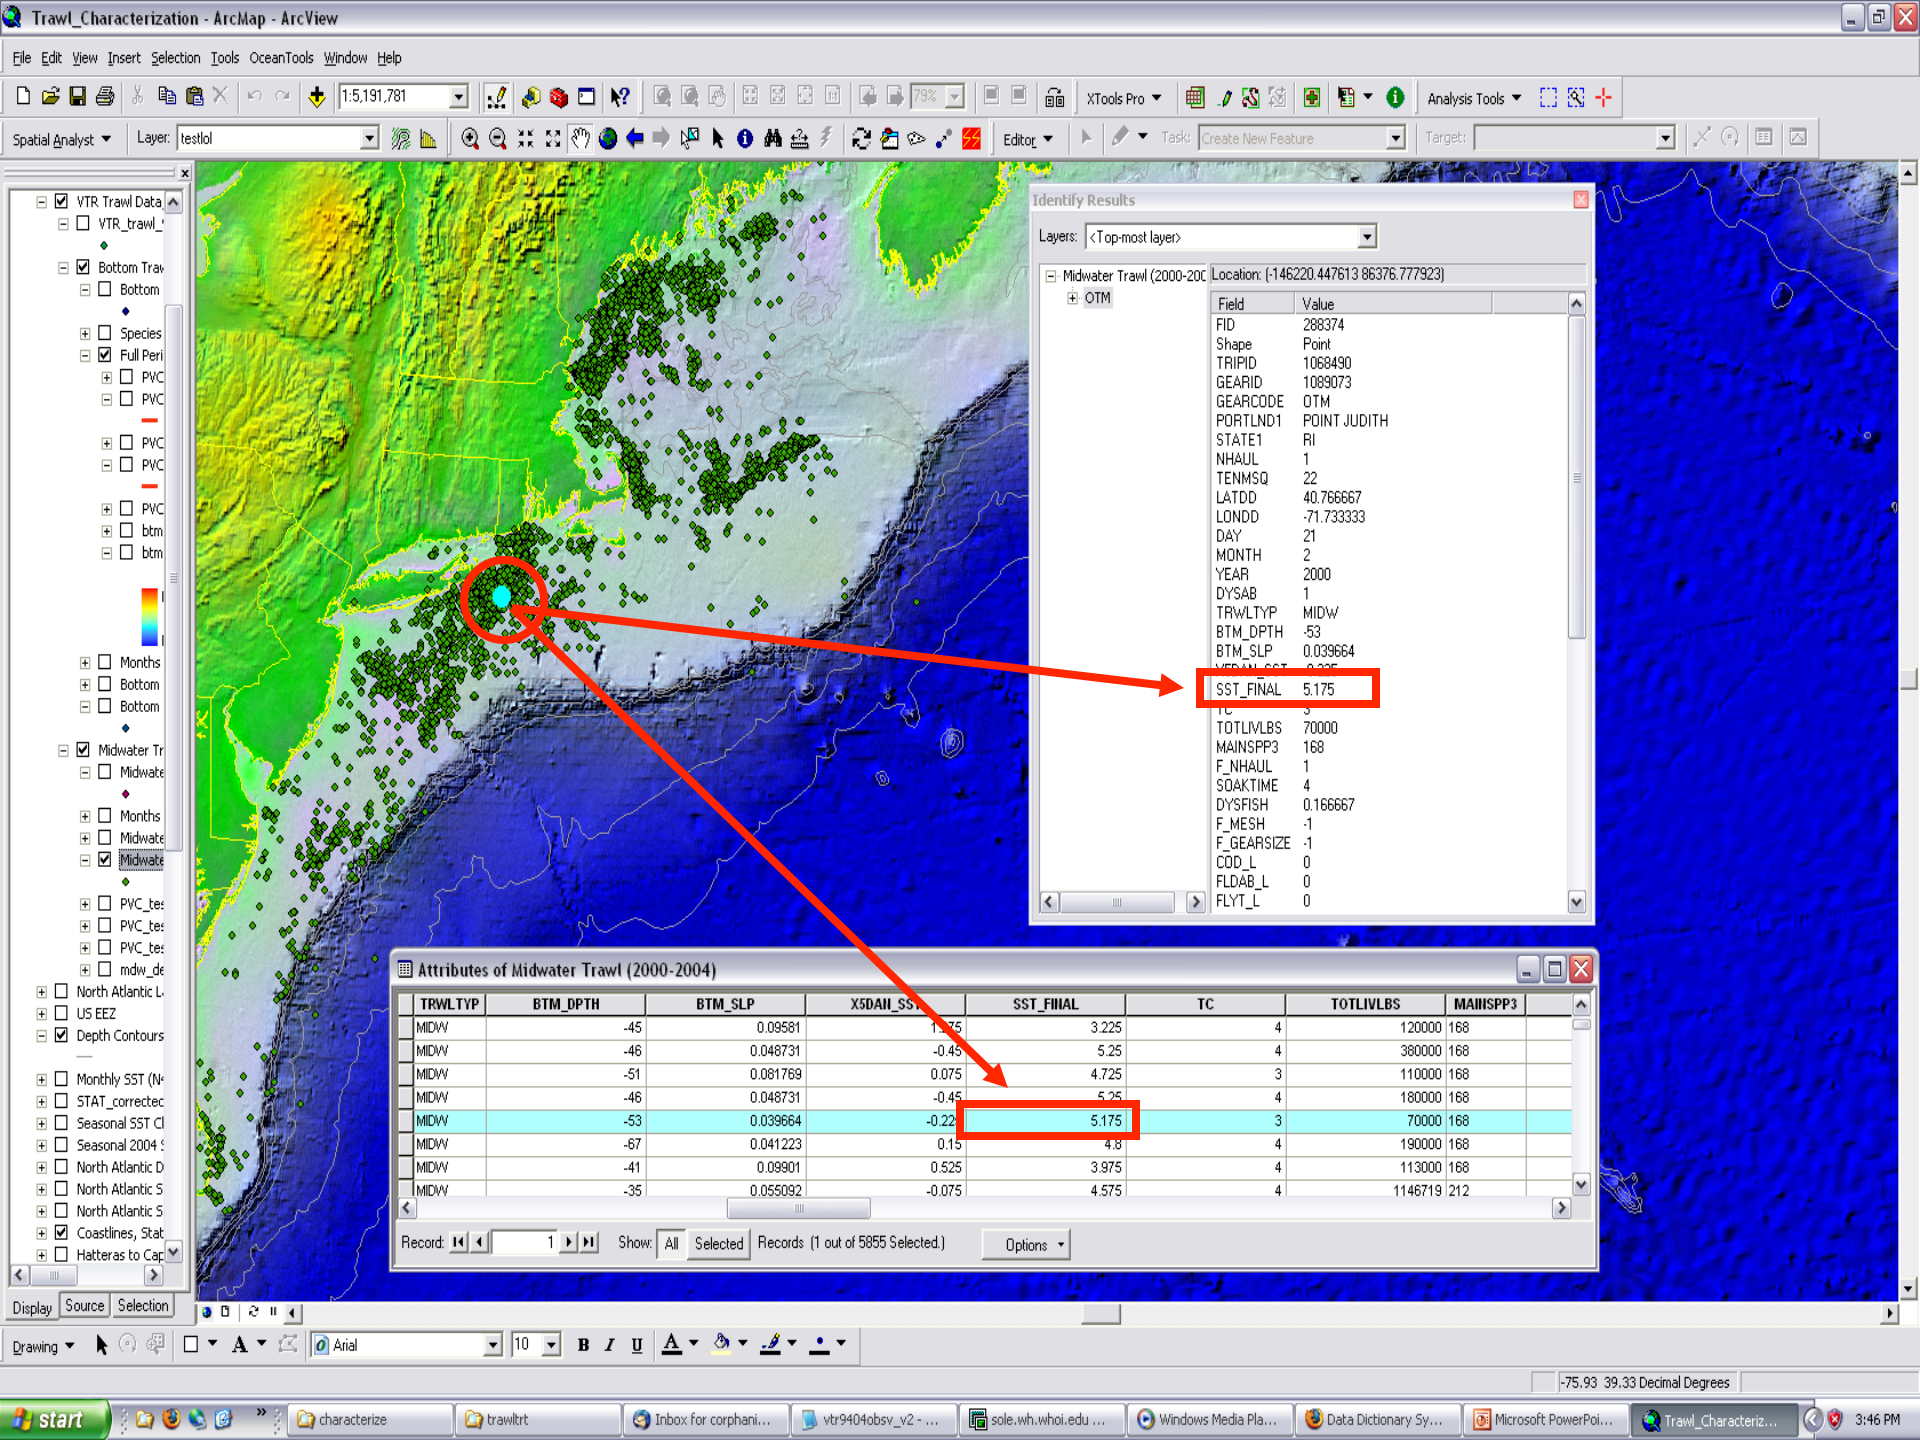

*Created by Chris Orphanides, NOAA Fisheries, Protected Species Branch, 2006*

**Select Fishing Location Shapefile**

**Default locations of Satellite Data provided**

**Specify Desired Products**

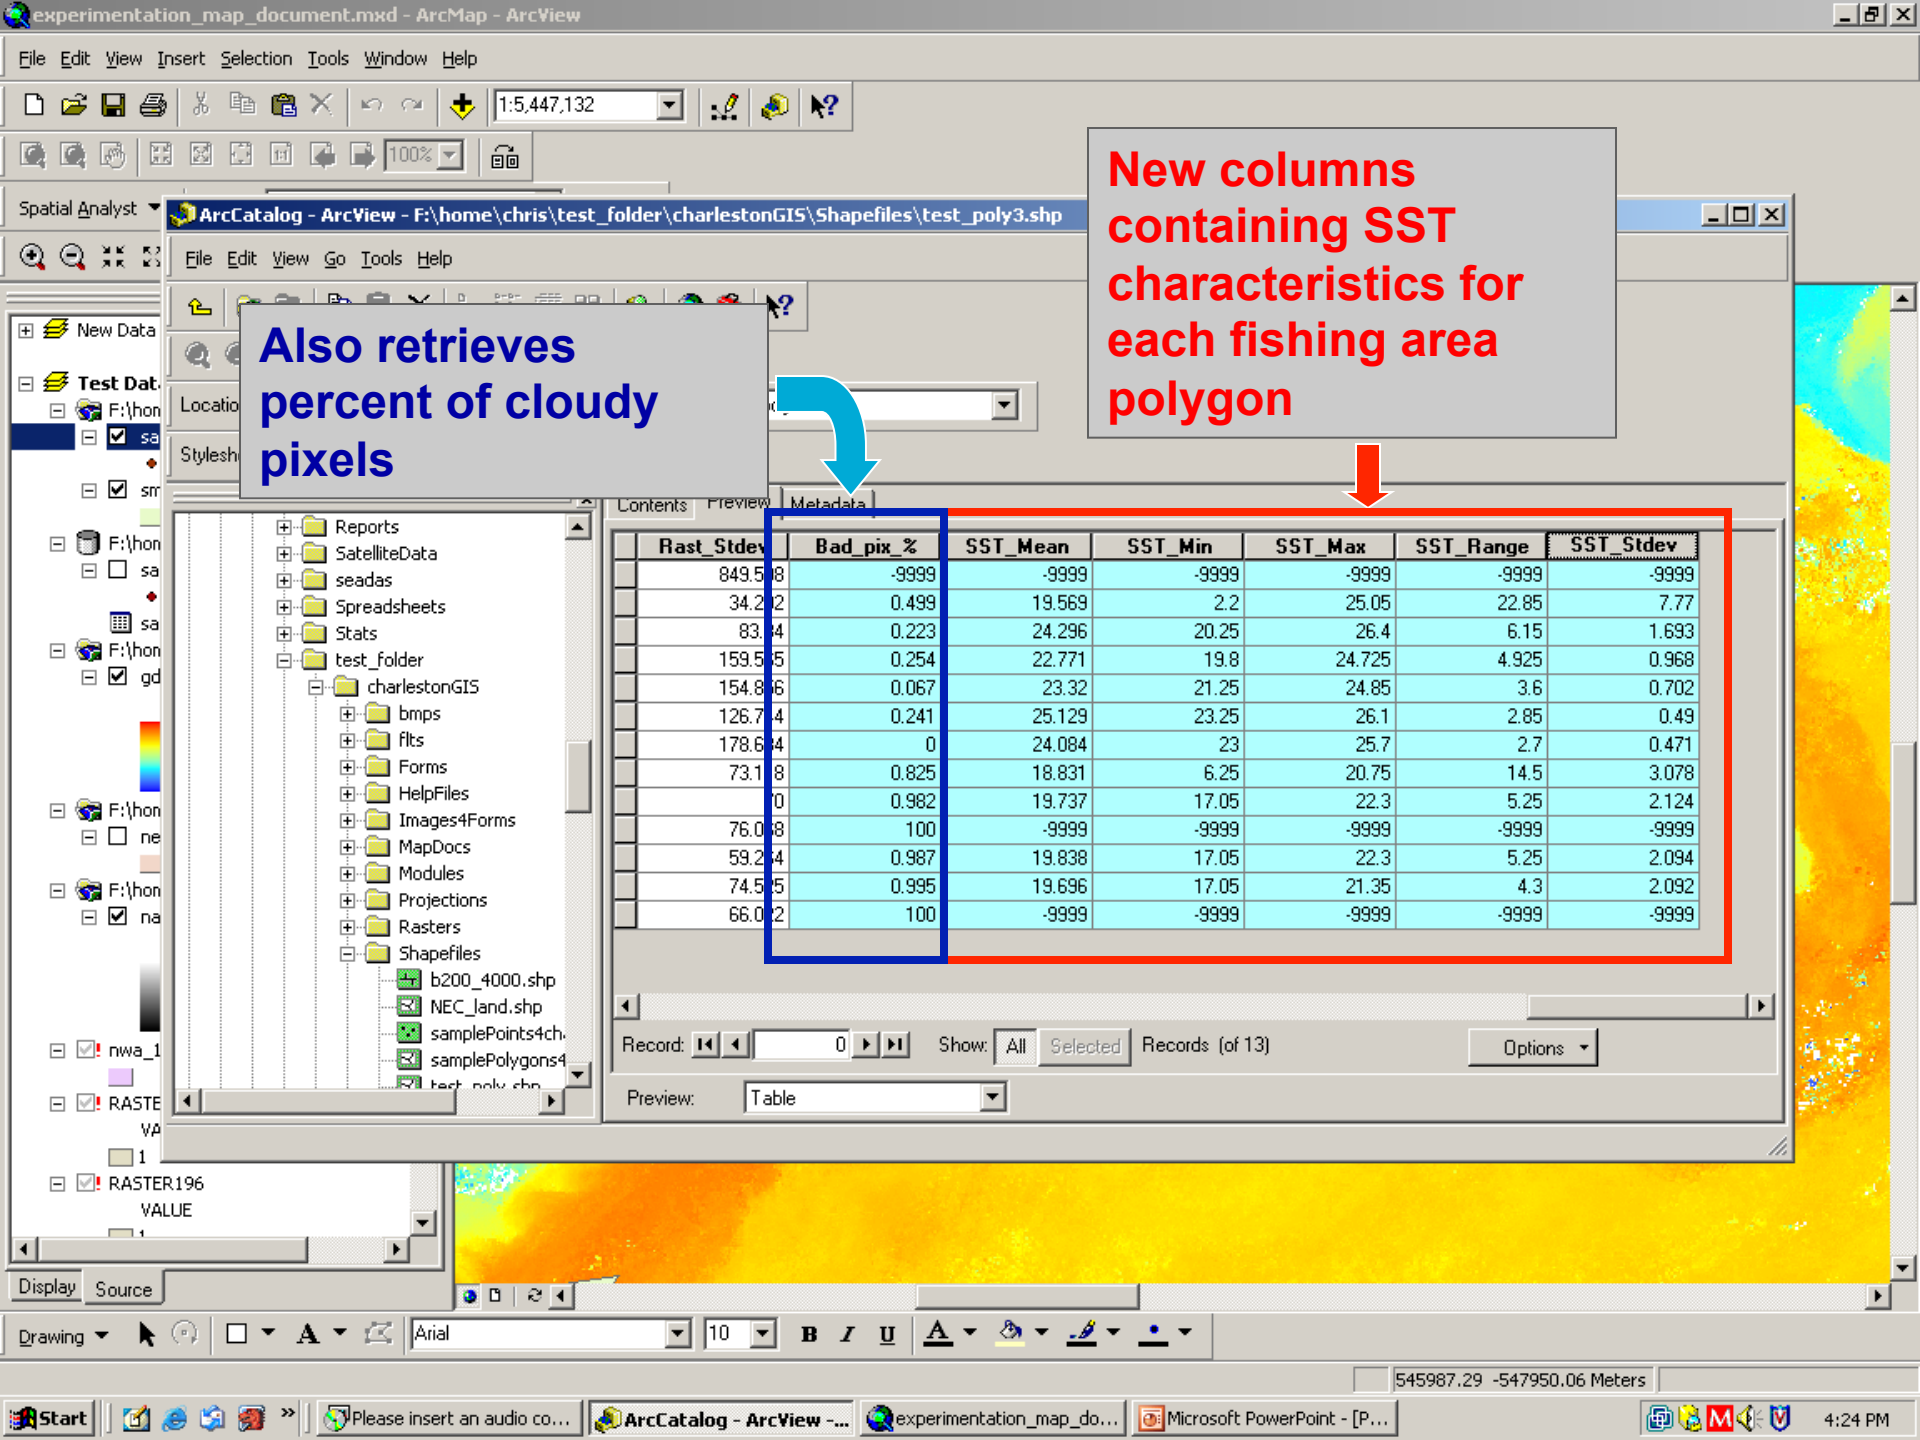

# Retrieving Satellite Data for Fishing Areas (polygons)

Polygons representing longline sets are plotted and overlaid onto satellite imagery or other imagery. The values within these polygons, representing temperature for example, are extracted.

To the right are two polygons representing longlining sets. The four points in each polygon represent the begin set, end set, begin haul, and end haul locations.

# Example of SeaWiFS Chlorophyll Image and a Corresponding Longline Set in December 2001

Close up of  
set sampled

SeaWiFS Chlorophyll (mg/m <sup>3</sup> )					
Arc Set ID	Mean	Min	Max	Range	Std Dev
200133606W01	0.8529	0.1689	16.861	16.6919	1.5044

Fishing set from December 2, 2001 shown as a red polygon overlaid over a December 4, 2001 single-day SeaWiFS chlorophyll image.

SeaWiFS chlorophyll characteristics for longline set on December 2nd of 2000.

# Resulting Data Set

(using polygons representing sets)

- Plus the original data in the observer database such as number of lightsticks, set time and haul, fish caught, etc.

# Northeast Variables Considered

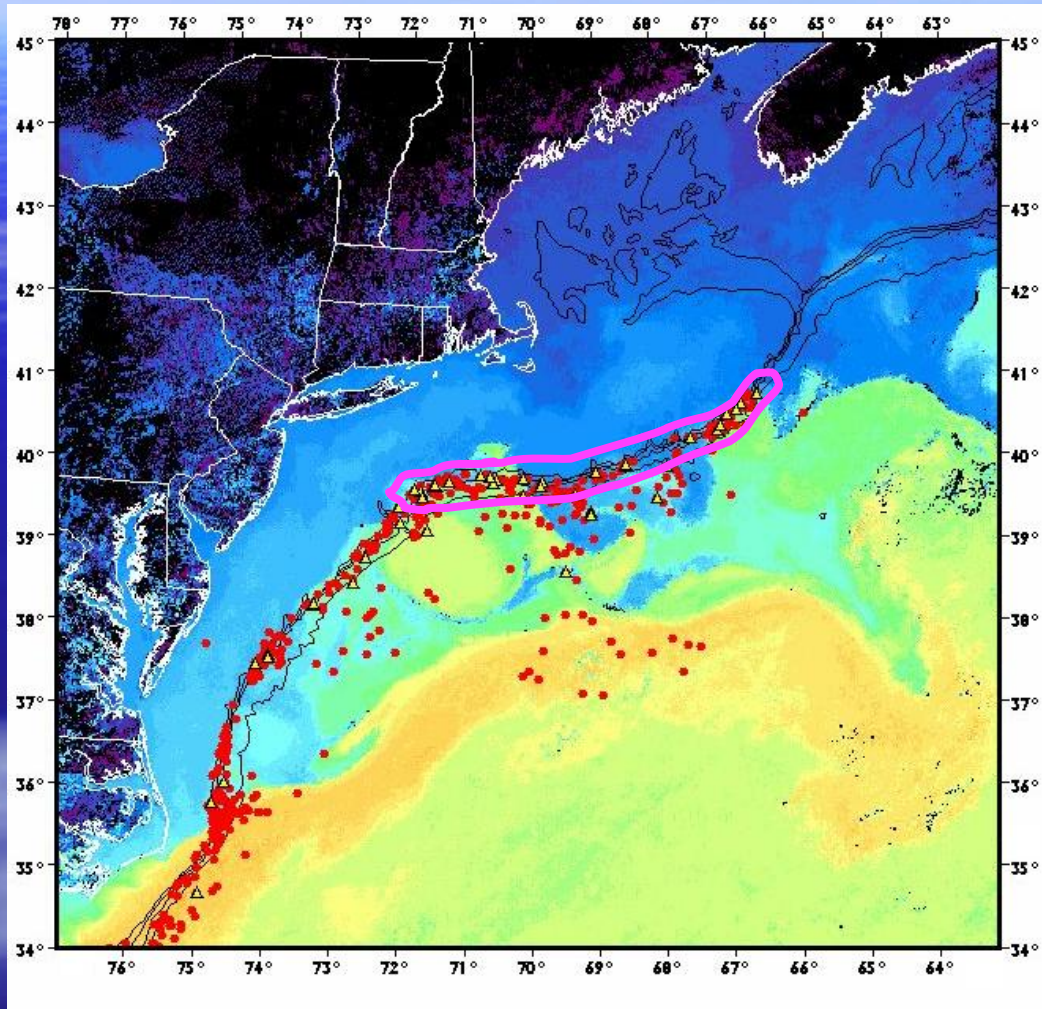

- Latitude
- Longitude
- Day of Year
- Depth
- Bottom Slope
- Chlorophyll
- Temperature
- Frontal Strength
- Lunar Cycle
- Canyons
- Soak Time
- Watermass
- Wind-driven Ekman Transport

# Variables important in distinguishing Northeast sets that caught loggerheads

- Latitude
- Longitude
- Day of Year
- Depth
- Bottom Slope
- Chlorophyll
- Temperature
- Frontal Strength
- Lunar Cycle
- Canyons
- Soak Time
- Watermass
- Wind-driven Ekman Transport

# Longline Turtle Bycatch Analysis

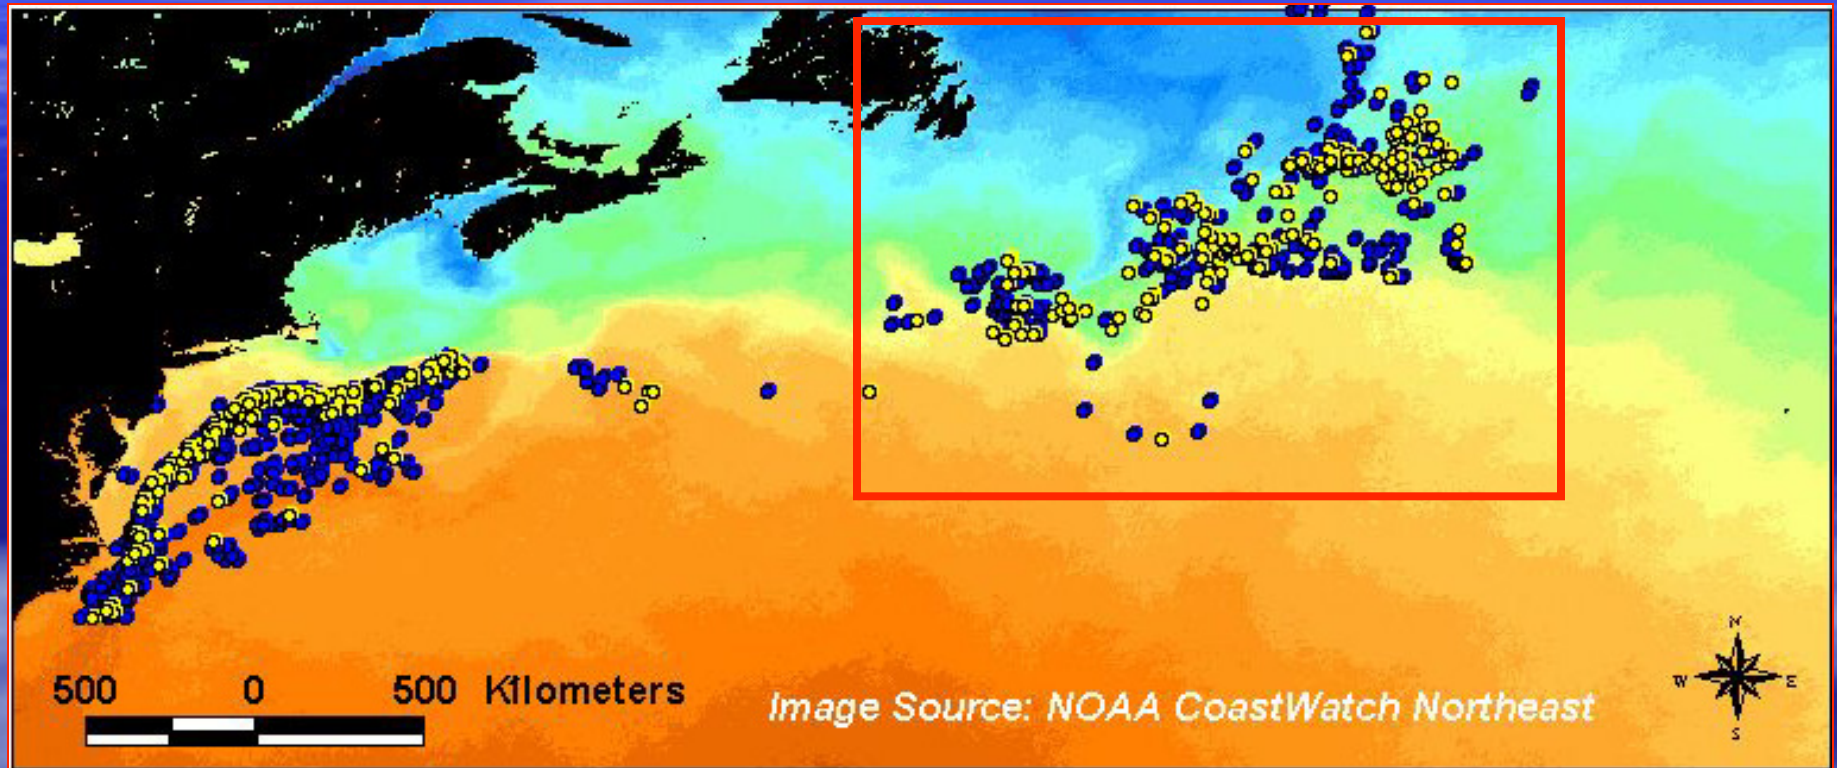

- Apparent temperature preference between 18 and 24°C
- Occupied shallower waters than the average longline set in the NEC region (500 - 1200 m)
- Preference for the shelf break north of 39° latitude, particularly in the fall
- Primarily associated with northern edges of warm core rings and the shelf/slope front
- Preference for fishing areas over submarine canyons
- Showed no distinction from longline sets with respect to bottom slope, chlorophyll levels, or perceived frontal strength

*Majority of loggerhead population is likely concentrated along the mid-continental shelf, inshore and south of the majority of longlining effort*

# Longline Turtle Bycatch Analysis

# Loggerhead Bottom Trawl Bycatch Modeling

*SST has been an important factor in modeling loggerhead bycatch*

October Loggerhead Bycatch

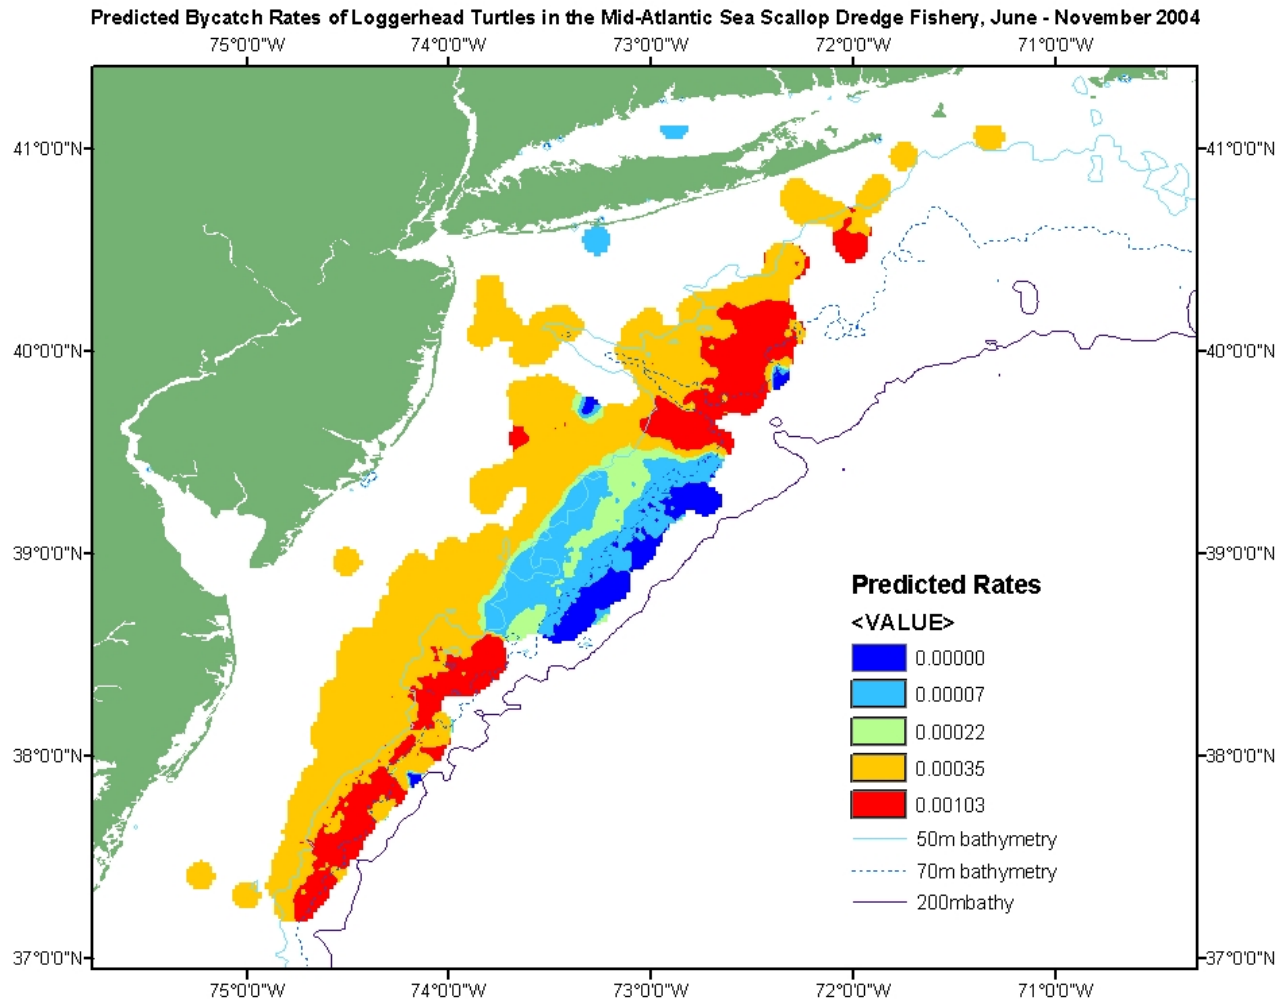

December Loggerhead Bycatch

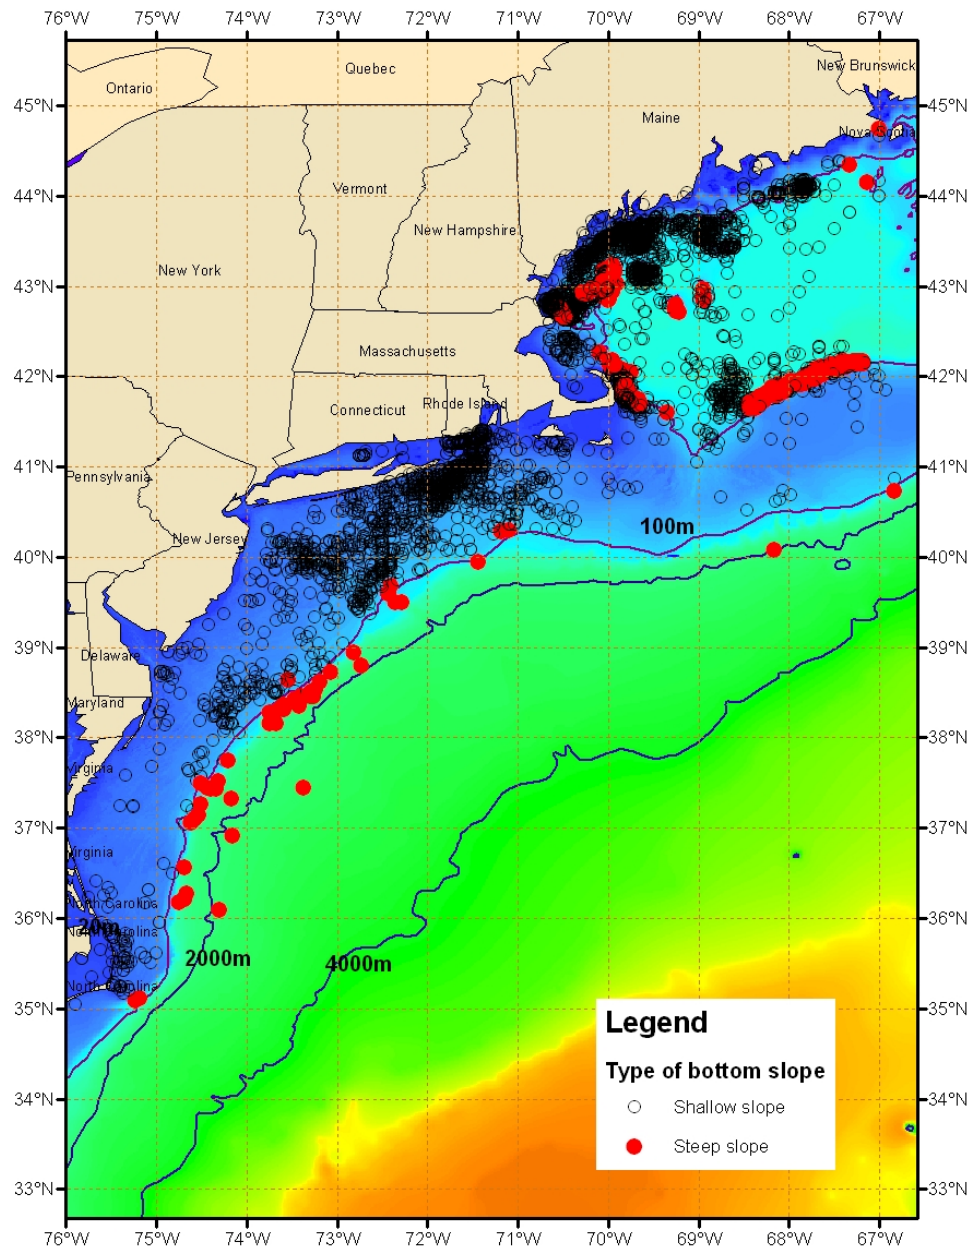

**Loggerhead distribution shifts with seasonal temperature changes**

*Bycatch estimate modeling by Kimberly Murray*

# Sea Scallop Dredge Turtle Bycatch Modeling

*Image courtesy of Kimberly Murray*

# Marine Mammal Midwater Trawl Bycatch Modeling

Model in development found **bottom slope** to be a significant factor for predicting bycatch of cetaceans in mid-water trawl fisheries.

Areas of steep bottom slope had higher rates of bycatch, and likely serve as a proxy for other oceanographic factors.

*Images courtesy of Debra Palka*

# Marine Mammal Bottom Trawl Bycatch Modeling

**Common Dolphin** bycatch in the trawl fishery

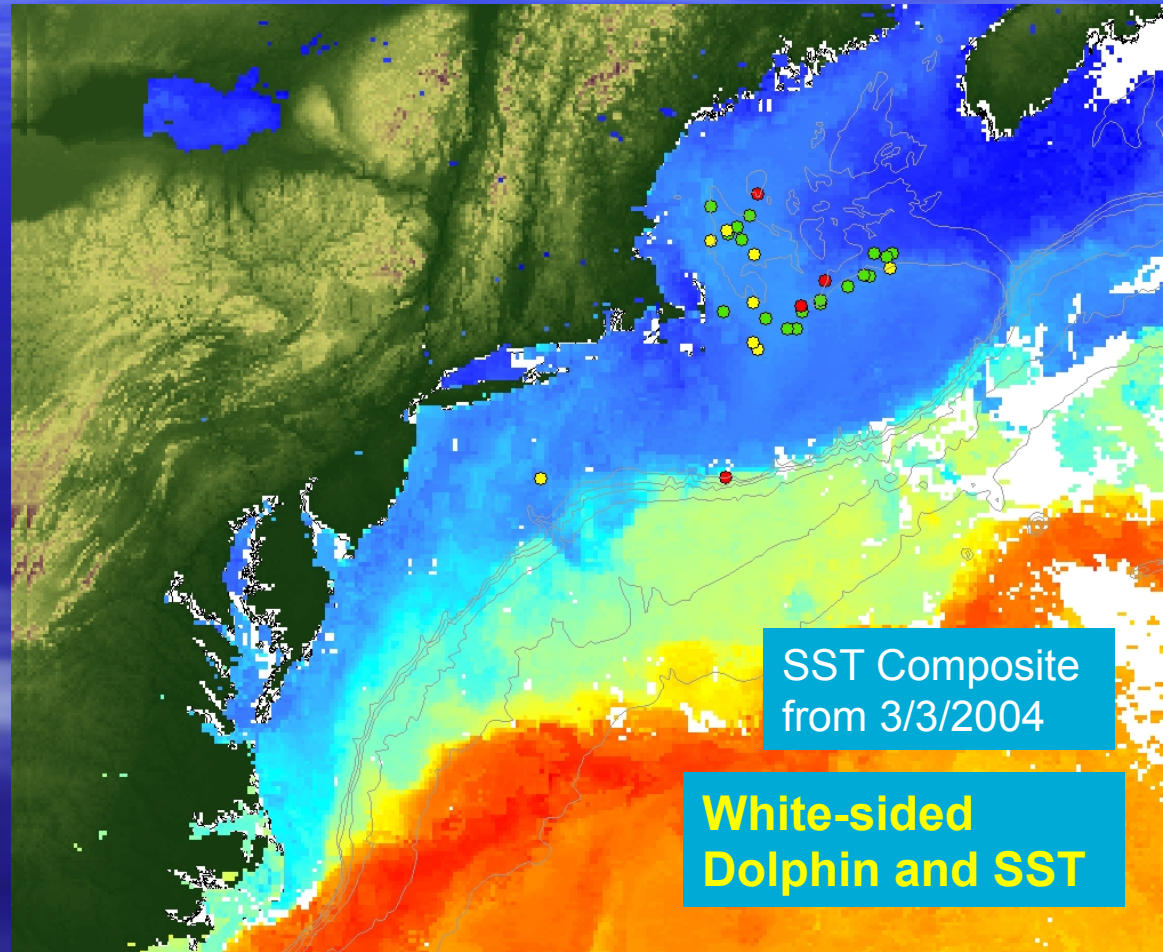

Model in development found **bottom depth** to be a significant factor for predicting bycatch.

**Pilot Whale** bycatch in the trawl fishery

Model in development found **bottom slope** to be a significant factor for predicting bycatch.

**White-sided dolphin** bycatch in the trawl fishery

Model in development found **SST** and **Depth** to be a significant factor for predicting bycatch.

# Marine Mammal Survey Data

- Maps of SST used to guide shipboard marine mammal surveys.
- Primarily looking for frontal regions

- Points show track of ship

# Marine Mammal Survey Data

Unidentified dolphin  
likely two species,  
common dolphin  
and possibly  
bottlenose dolphins

**Unidentified  
Dolphin**

**Common  
Dolphin**

**Bottlenose  
Dolphin**

**Identification of unidentified animals  
in abundance survey using SST**

*Image courtesy of Debra Palka*

# Other Current and Future Projects

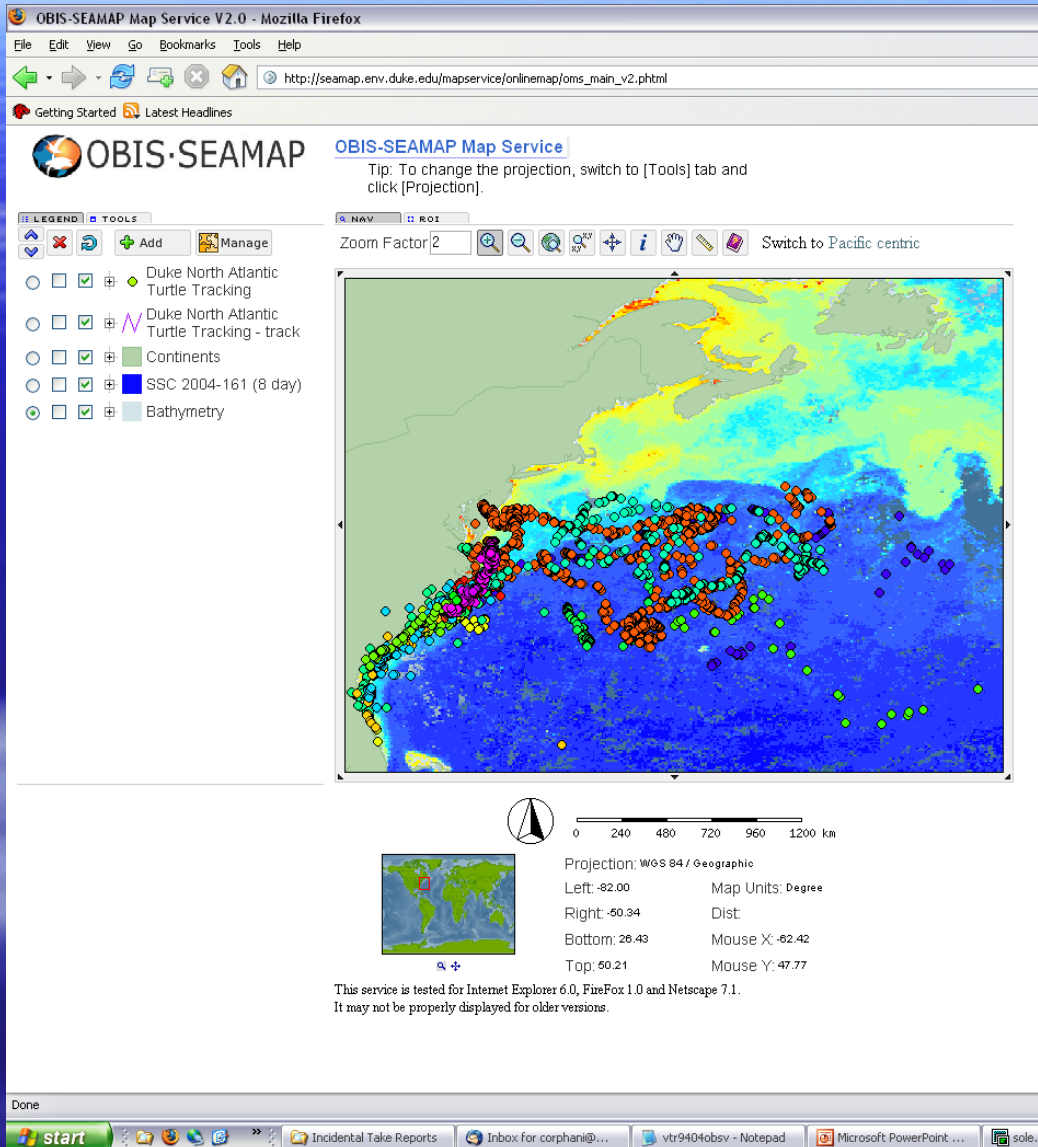

## Applying Satellite Data

- Examining possible link between sea turtle bycatch and high inter-annual variability in summer chlorophyll off the coast of New Jersey
- Examining sea turtle bycatch distribution across multiple fisheries relative to a number of environmental variables (including SST, chlorophyll, oceanographic fronts, bathymetric features, bottom temps, water column stratification, etc.)
- Distribution of satellite tagged leatherbacks relative to oceanographic variables
- Harbor porpoise gillnet bycatch model

# Summary

- 1) Satellite data is being used effectively in the NEFSC, particularly with protected species. However, it could be made much more user-friendly.
- 2) Due to dynamic ocean and cloud cover, downloadable 3 and 5 day satellite data composites would be very useful.
- 3) Providing data in a GIS-ready format would facilitate use by fisheries scientists.
- 4) Providing tool, ideally online, for retrieving data from satellite data from time series in a batch mode for fishing locations and areas

# OBIS-SeaMAP Project

Ocean Biogeographic  
Information System - Spatial  
Ecological Analysis of  
Megavertebrate Populations

**Example –  
Satellite tracked  
sea turtles over 8-  
day chlorophyll  
image**

Developing online mapping  
capabilities, mapping marine  
data over satellite data

**Source: [http://  
seamap.env.duke.edu/](http://seamap.env.duke.edu/)**

# Satellite Tracking and Analysis (STAT) Tool

STAT is an online tool for linking satellite data to satellite-tagged marine animals

*In their words:* 'An integrated system for archiving, analyzing, and mapping, marine vertebrate satellite tracking data'

# THE END

*Special Thanks to:*

Cara Wilson for inviting me to present, and to Jay O' Reilly, Debra Palka, Kimberly Murray, Marjorie Rossman for their contributions to this presentation.

# Loggerhead Bycatch Modeling

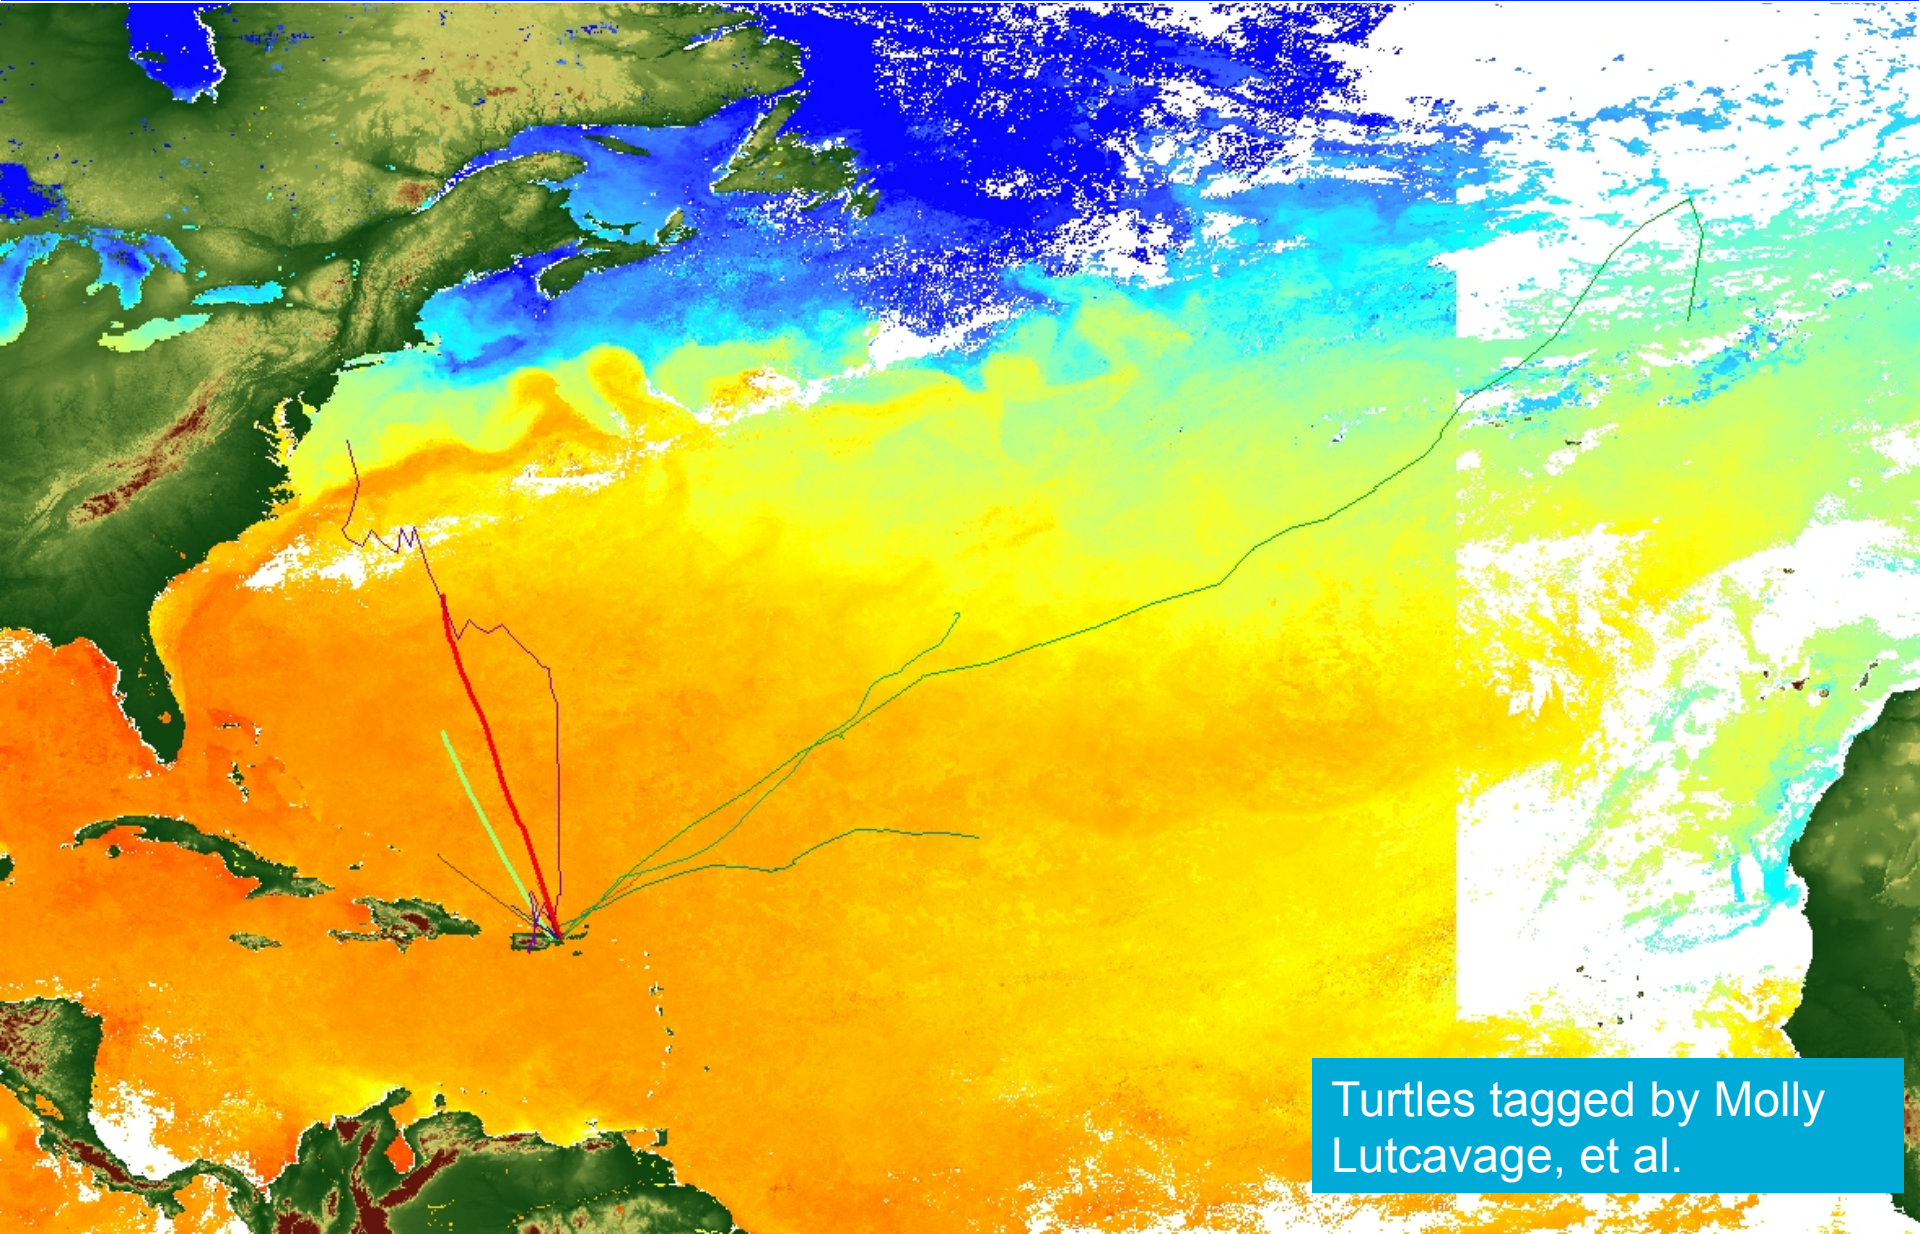

PSB is also investigating loggerhead bycatch relative to oceanographic fronts

**Turtle Bycatch in Scallop Dredge Gear, Oct 1-10, 2001-2004**

# Leatherback Migration

Turtles tagged by Molly  
Lutcavage, et al.

## 2001 day 251 GOES SST 5-day composite

Graph based on observer data  
from 1990-2000

2001 sets that caught loggerheads from days  
248 to 256
